BDI Website Admin Panel

User Guide & UAT Notes • Part 1 (Main Scope) • November 2026

Admin panel	https://bdi-admin.sanity.studio
Test website	(Netlify staging link — provided with this document)

How the admin panel works — two rules to remember

• **Nothing goes live until you press Publish.** While you edit, your changes are saved automatically as a private draft. Visitors keep seeing the current website until you press the blue **Publish** button. After publishing, the website updates within seconds.

• **You can always undo.** If you change your mind before publishing, open the "■" menu next to the Publish button and choose **Discard changes** — the document returns exactly to its last published state. Feel free to experiment: the panel will not let you publish anything broken (see "Built-in protections" below).

What was implemented — requirement by requirement

The table below mirrors Part 1 of the technical assignment ("BDI Website Admin Panel — Revised Scope"), page by page.

Page	Requirement	What you can now do
Homepage	Editable hero image; display selected Before & After cases from Smile Gallery.	Replace the large photo at the top of the homepage. Choose which **3 cases** from the central Smile Gallery library appear in the "Real Patients. Meaningful Change" section.
Dental Implants	Editable hero image; display selected Before & After cases from Smile Gallery.	Replace the hero photo. Optionally choose up to 3 gallery cases — a Before & After section (same design as the homepage) appears on the page only when cases are selected.
Smile Gallery / Patient Results	Centralized management of patient cases and Before & After photos.	One central **Patient Cases** library. Add, edit, hide, reorder or delete cases; the gallery page grows automatically as cases are added. Each case is stored once and reused everywhere.
Pricing & Financing	Edit all existing prices, pricing tables and descriptions.	Every price, price range, table row, the New Patient Offer ($ amount and its bullet list) and the page texts are editable. **Price changes go live on Publish — no code changes, no rebuild, no developer needed.**

Scope note: the "Financing & Payment Options" block lives on the homepage and its wording rarely changes, so it remains fixed text for now; financing provider logos are not present on the current website design. Both can be made editable later as a small addition if needed.

The central idea: one library, used everywhere

Every patient case (a Before photo, an After photo and a short quote) is stored **once** in "Smile Gallery — Patient Cases". The Smile Gallery page, the Homepage and the Dental Implants page all display cases *from this one library*. Update a photo or a quote in one place — it updates everywhere that case is shown, with no duplicate uploads. This is exactly the centralized approach requested in the assignment, and it is why managing content stays simple as the gallery grows.

Two small controls on every case

- **"Show in Smile Gallery" toggle** — controls whether the case appears on the public Smile Gallery page. Switched off, the case stays in the library (and can still be featured on the Homepage or the Implants page) but is hidden from the gallery. Think of it as publish/unpublish for the gallery.
- **"Sort Order"** — sets the order of cases on the gallery page: lower numbers appear first. Existing cases are numbered 10, 20, 30… so a new case can be placed between any two (e.g. 15) or put first (e.g. 5). The gallery is not limited to six cases — new ones simply start a new row on the page.

Everyday tasks, step by step

Add a new patient case

1. Open **Smile Gallery — Patient Cases** and press the **+** button (top of the list).
2. Fill in the case name (internal, not shown on the website) and the patient quote.
3. Upload the **Before** and **After** photos — drag a file in, press **Upload**, or press **Select** to reuse a photo already in the library. Use the same framing for both photos so the slider lines up.
4. Set the Sort Order (where it appears in the gallery) and press **Publish**.

Choose which cases appear on the Homepage (or the Implants page)

1. Open **Homepage** (or **Dental Implants Page**) and find "Selected Cases".
2. To swap a case: open its "■" menu, choose **Replace**, and start typing another case's name.
3. To add one (Implants page): press **Add item** and pick a case from the list. "Create new" inside that menu creates a brand-new case — it is saved into the central library automatically.
4. Press **Publish**.

Change a hero image or a price

1. Open the page document (Homepage, Dental Implants Page, or Pricing & Financing Page).
2. For photos: hover the image, open "■" and choose **Replace** (or just drag a new file onto it). For prices and texts: simply type the new value.
3. Press **Publish** — the website updates within seconds.

Built-in protections (you cannot break the website)

- The Homepage must always show **exactly 3** cases: removing one below three, adding a fourth, selecting the same case twice, or leaving an empty slot all block the Publish button with a clear message

until fixed.

• Required fields (case name, Before/After photos, prices) must be filled before publishing.

• A case that is featured on a page cannot be deleted until it is removed from that page first — so a page can never point to a missing case.

• And if anything looks wrong in a draft — **Discard changes** restores the published version.

Photos: formats and size

Accepted formats: **JPG, PNG, WebP or HEIC** (iPhone photos work as-is). Recommended size: up to ~20 MB per photo. You never need to resize or compress anything — the website automatically generates optimized versions for every screen. Hero photos look best at 2400px wide or more; these hints are also shown under each photo field in the panel.

What we ask you to do during UAT

1. Open the test website and click through the four pages — confirm everything looks right.

2. Sign in to the admin panel (you will receive an email invitation) and try the everyday tasks above: change a price, swap a homepage case, add a test case to the gallery, then delete it.

3. Note anything confusing or unexpected and send the list back — it will be addressed before go-live.
